

Helmholtz: fitting error and ordinary-MLP encoding error are separate limits

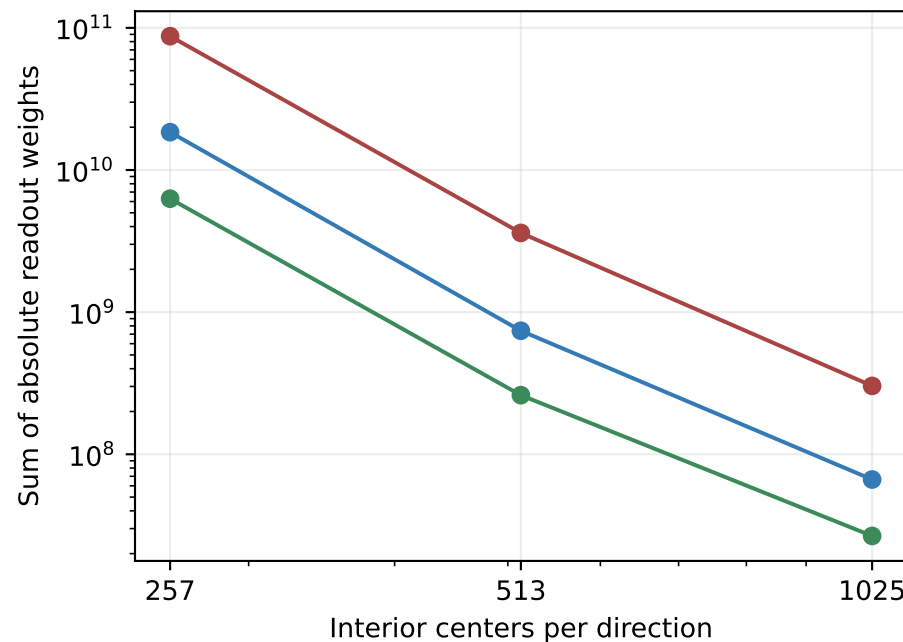

$\lambda=0.16$
 $\lambda=0.20$
 $\lambda=0.24$

Same native p32 coefficients

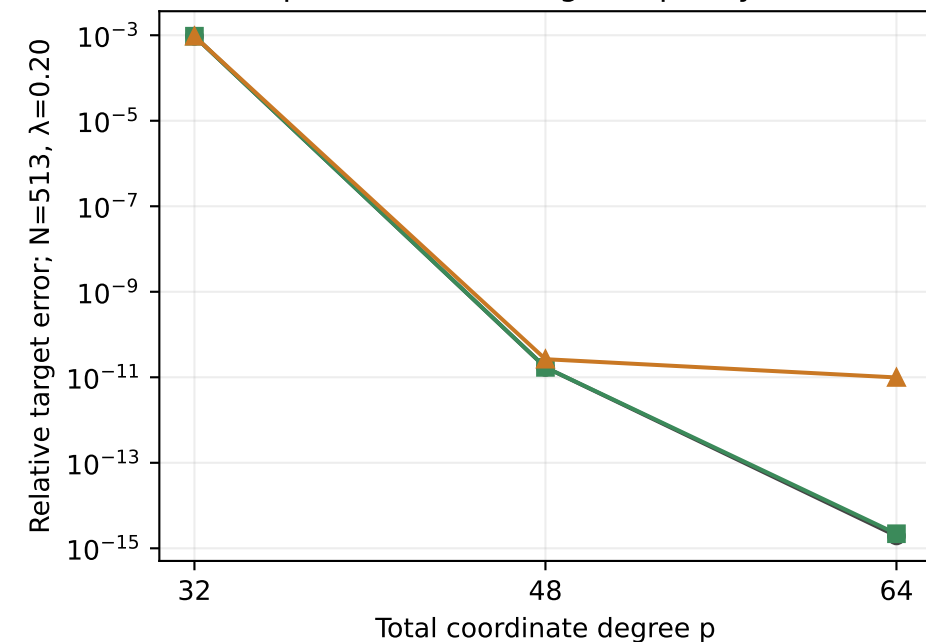

$\lambda=0.16$
 $\lambda=0.20$
 $\lambda=0.24$

Halo cancellation becomes smaller

Ideal coordinates
 Stable neural evaluation
 Ordinary tanh MLP

Separate known-target capacity audit

Left/middle: fixed native coefficients, no refit; their ideal target error remains 3.222%. Right: explicit Bessel coefficients, capacity only, never used to initialize a PDE solve.
