

Native 3D Navier-Stokes through time: four inputs, ordinary tanh MLP

Smooth manufactured flow on $[-1, 1]^3 \times [0, 0.25]$; forcing, boundary and initial values only.

Final: 751,689 tanh neurons; 19,380 solved coordinates; no external PDE trajectory.

Final audit: 2,048 values, 1,024 derivative points, plus walls, initial surface and all 16 corners.

Corner max field error = 1.32×10^{-13} . Sequential continuation; this does not establish uniform 10^{-14} accuracy.
